1. SCOPE

- 1.1 The purpose of this document is to facilitate and provide the required prescribed Load Tables for the running of Transnet Freight Rail air and vacuum brake trains.
- 1.2 This document does not singularly authorize the running of any airbrake train/s. All airbrake trains must be covered by a Technical Train Operating Instruction as specific or unique circumstances for particular trains or routes might well exist. The Load Table/s depicted in a Technical Train Operating Instruction will take precedence over loads as displayed in this document for the running of the specific trains as authorized by such Technical Train Operating Instruction.
- 1.3 This document also does not authorize the running of any trains conveying damaged, un-roadworthy or unbraked vehicles/locomotives, neither any other train type where special circumstances might exist. A Special Authority for the running of such train types must be obtained from the Technology Management, Train Design Technologies department.
- 1.4 This document details the Load Tables that should be utilized for such trains and cancels and supersedes documents S.SD/TBF/13/2/1/2 dated 31 August 1995 and any/all earlier revisions of documents with reference S.GFB/TES/TE/OI 0272.
- 1.5 This revision has been issued whereby provision has been made for the class TAL 2000 diesel locomotives within the load tables provided.

2. INTRODUCTION AND RESTRICTIONS

- 2.1 The enclosed Load Tables indicate the combinations of locomotives and trainloads that may be operated. The train combinations, maximum tonnage and minimum number of locomotives are reflected in these tables.
- 2.2 The lowest "Gradient Category" derived from the diagrams provided over the relevant sections must be utilised to determine the load contained in the relevant Load Table.
- 2.3 The minimum number of locomotives, as indicated in the attached tables, must in all instances be used for tractive effort purposes.
- 2.4 The absolute maximum number of locomotives in a train consist for airbrake trains is six (6), for vacuum brake trains the maximum is four (4).
- 2.5 The load of the train includes all wagons and any dead locomotives. If the mass of any dead locomotives can be accommodated within the allowable load, the number of wagons need not be decreased by the equivalent tonnage.
- 2.6 The electric brakes of active locomotives in a train consist must be engaged to a maximum of four. The exception being classes 6E/6E1, 22E, 23D, 43D, 44D and 45D where the electric brakes of a maximum of three locomotives in the consist must be engaged. This unless otherwise specified or pertinently overruled by a particular Technical Train Operating Instruction, in which case the clause will not be

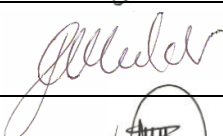

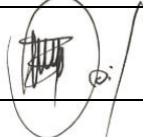

PRESCRIBED LOAD TABLES FOR THE RUNNING OF TRANSNET FREIGHT RAIL AIR AND VACUUM BRAKE TRAINS		Document Number : S.GFB/TES/TE/OI 0272
Compiling officer:	A.R. Boy : 	Revision Number : 18
1st Technical Approving Officer	A.R. Boy : 	Issue date: 2018-01-26

Approving Safety Officer:	M. Dlamini : 	

relevant and the conditions as stipulated by such document will prevail for the particular train types as authorised accordingly.

- 2.7 If dead locomotives are hauled as part of the load the number thereof, may not exceed the number of active locomotives in the consist.
- 2.8 All over-border loads must be compiled, from point of origin, in accordance to the conditions specified in these load tables. This to prevent wagons being unnecessarily detached en-route. Loads are thus not optimal in all cases.
- 2.9 Axle length restrictions due to station and interloop lengths for the crossing of trains and staging areas must still be adhered to.
- 2.10 It is essential to specify standard loads for “through” trains, this to eliminate any resultant contradictions.
- 2.11 Prior to the departure of the train it must be ensured that the number of locomotives as provided for traction purposes are acceptable and prove adequate for the charging of the train brake system. If difficulty is experienced in the charging of the train brake system an examination for potential leaks should be performed. Provided no leaks are identified either additional locomotive/s must be provided to facilitate the charging of the train brake system, or alternatively an appropriate number of wagons should be removed from the train.
- 2.12 The following clauses are highlighted with reference to document BBD 5249 (Version 1) dated October 2008 and titled ‘Alarm Limits for the Measurement of Weighbridges, Wheel Impact Monitors and Skew Bogie Detectors’.

Overloading.

1. Relevant to both vacuum and airbrake trains the maximum allowable overload permitted for the train to continue is ‘One (1) ton X the Number of Wagons on the Train’. Thereafter a sufficient number of wagons must be removed from the train to ensure that the train load is kept within the specified limits.
 2. The train must be stopped where the gross wagon mass of any wagon is identified as being 7% or higher for the specific wagon. Any such identified wagon should be removed from the train accordingly.
- 2.13 The method of load determination for a locomotive consist containing a combination of 34 and 37 class diesel locomotives is as follows, -
1. Determine the number of each specific locomotive type in the consist.
 2. Determine the gradient category for the relevant section. (Refer to “Section 4” of this document)
 3. Refer to the load tables as contained in “Section 5” of this document, under the relevant locomotive category cross reference the two known variables (gradient category and number of locomotives for each specific locomotive class) for each relevant locomotive class type as contained in the consist to determine the amount of tons that may be hauled over the specific section.

PRESCRIBED LOAD TABLES FOR THE RUNNING OF TRANSNET FREIGHT RAIL AIR AND VACUUM BRAKE TRAINS		Document Number : S.GFB/TES/TE/OI 0272
Compiling officer:	A.R. Boy : 	Revision Number : 18

2nd Technical Approving Officer	J.M. Mulder : 	Page Number : 4 of 44
Approving Safety Officer:	M. Dlamini : 	

4. Add the different determined tonnage amounts together in order to determine the total load the specified combined consist can haul over the relevant section.

It should be noted that this method of calculation is only valid where the balancing speed of the different locomotive classes is the same.

Example

Assume the following, -

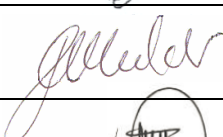

1. A four locomotive diesel consist contains,
 - 2 x 34D
 - 2 x 37D
2. The ruling gradient over the section is a 1:35 and the average axle mass loading of the vacuum braked train is 18.5 tons per axle.

As per the above information a 1:35 ruling gradient corresponds to a “gradient category 2”.
(refer to “Section 3” of this document)

Now refer to “Section 5.1” of this document that contains the load table for vacuum brake trains of axle mass loading greater than 10 tons per axle. It can now be established that the loads for 2 x 34 and 2 x 37 class diesel locomotives would be 1140 and 1280 tons respectively. Therefore it can easily be established that the allowable tonnage for the 34 and 37 class diesel locomotives in the consist would be 2420 tons.

Thus the total permissible tonnage for the train would be 2420 tons. (1140 + 1280 = 2420 tons)

- 2.14 The class 43D and 44D locomotives are solely authorized for MU operation with each other irrespective of which locomotive class is in the ‘lead’ and which is in the ‘trail’ position respectively.
- 2.15 The class 45D locomotives are currently not authorized to MU with any other class TFR locomotive/s.
- 2.16 The class 20E locomotives are currently not authorized to MU with any other class TFR locomotive/s.
- 2.17 The class 21E locomotives are currently not authorized to MU with any other class TFR locomotive/s.
- 2.18 The classes 22E locomotives are currently solely authorized to MU with diesel locomotive/s.
- 2.19 The class 35-800D locomotives are not authorized to MU with any other class TFR diesel locomotives as it is only possible to couple the brake pipe through. It must additionally be noted that the brake pipe needs to be coupled straight across and not under the coupler as is the current TFR regime, as this leads to the pipes uncoupling when negotiating a cross over or tight curve.

NOTE: These Gradient Categories must only be used for the calculation of Airbrake Train Loads up to a maximum length of 50 wagons and for Vacuum brake trains. Gradient Categories tagged with an asterisk "*" must be used for the determination of loads for Class 35 or Class 36 Locomotives, where provided for. Gradient Categories tagged with an asterisk "*" must be used for the determination of loads for Vacuum brake trains, where provided for.

RELEVANT TO VACUUM BRAKED TRAINS THE FOLLOWING RESTRICTIONS MAY NOT BE EXCEEDED:

- Maximum train speed of 60 km/h.
- Maximum average axle load per train of 18.5 ton per axle.
- Maximum axle load per truck per axle of 20 ton.
- Maximum train length of 40 trucks (160 axles).
- Maximum train length on specific line as restricted in WTB.
- Maximum axle load restriction on specific line.
- Maximum total load of 2560 ton on category 1 lines where SASKOP-couplers are used.
- Maximum number of locomotives in a consist is four (4).

Notes :

- 'GC' Means Gradient Category.
- Refer to point 5.9 below for Load Tables relevant to Passenger Trains.

RELEVANT TO VACUUM BRAKED TRAINS THE FOLLOWING RESTRICTIONS MAY NOT BE EXCEEDED:

- Maximum train speed of 60 km/h.
- Maximum average axle load per train of 18.5 ton per axle.
- Maximum axle load per truck per axle of 20 ton.
- Maximum train length of 40 trucks (160 axles).
- Maximum train length on specific line as restricted in WTB.
- Maximum axle load restriction on specific line.
- Maximum total load of 2560 ton on category 1 lines where SASKOP-couplers are used.
- Maximum number of locomotives in a consist is four (4).

Notes :

- 'GC' Means Gradient Category.
- Refer to point 5.9 below for Load Tables relevant to Passenger Trains.

RELEVANT TO VACUUM BRAKED TRAINS THE FOLLOWING RESTRICTIONS MAY NOT BE EXCEEDED:

- Maximum train speed of 60 km/h.
- Maximum average axle load per train of 18.5 ton per axle.
- Maximum axle load per truck per axle of 20 ton.
- Maximum train length of 40 trucks (160 axles).
- Maximum train length on specific line as restricted in WTB.
- Maximum axle load restriction on specific line.
- Maximum total load of 2560 ton on category 1 lines where SASKOP-couplers are used.
- Maximum number of locomotives in a consist is four (4).

Notes :

- 'GC' Means Gradient Category.
- Refer to point 5.9 below for 18E Electric Locomotive Load Tables relevant to passenger trains.

RELEVANT TO VACUUM BRAKED TRAINS THE FOLLOWING RESTRICTIONS MAY NOT BE EXCEEDED:

- Maximum train speed of 60 km/h.
- Maximum average axle load per train of 18.5 ton per axle.
- Maximum axle load per truck per axle of 20 ton.
- Maximum train length of 40 trucks (160 axles).
- Maximum train length on specific line as restricted in WTB.
- Maximum axle load restriction on specific line.
- Maximum total load of 2560 ton on category 1 lines where SASKOP-couplers are used.
- Maximum number of locomotives in a consist is four (4).

Notes :

- 'GC' Means Gradient Category.
- Refer to point 5.9 below for Load Tables relevant to Passenger Trains.

RELEVANT TO VACUUM BRAKED TRAINS THE FOLLOWING RESTRICTIONS MAY NOT BE EXCEEDED:

- Maximum train speed of 60 km/h.
- Maximum average axle load per train of 18.5 ton per axle.
- Maximum axle load per truck per axle of 20 ton.
- Maximum train length of 40 trucks (160 axles).
- Maximum train length on specific line as restricted in WTB.
- Maximum axle load restriction on specific line.
- Maximum total load of 2560 ton on category 1 lines where SASKOP-couplers are used.
- Maximum number of locomotives in a consist is four (4).

Notes :

- 'GC' Means Gradient Category.
- Refer to point 5.9 below for Load Tables relevant to Passenger Trains.

The class 35-800D locomotives are not authorized to MU with any other class TFR diesel locomotives as it is only possible to couple the brake pipe through. It must additionally be noted that the brake pipe needs to be coupled straight across and not under the coupler as is the current TFR regime, as this leads to the pipes uncoupling when negotiating a cross over or tight curve.

RELEVANT TO VACUUM BRAKED TRAINS THE FOLLOWING RESTRICTIONS MAY NOT BE EXCEEDED:

- Maximum train speed of 60 km/h.
- Maximum average axle load per train of 18.5 ton per axle.
- Maximum axle load per truck per axle of 20 ton.
- Maximum train length of 40 trucks (160 axles).
- Maximum train length on specific line as restricted in WTB.
- Maximum axle load restriction on specific line.
- Maximum total load of 2560 ton on category 1 lines where SASKOP-couplers are used.
- Maximum number of locomotives in a consist is four (4).

Notes :

- 'GC' Means Gradient Category.
- Refer to point 5.9 below for Load Tables relevant to Passenger Trains.

18	280	3400						18	3800						18	4000						18	2400					

RELEVANT TO VACUUM BRAKED TRAINS THE FOLLOWING RESTRICTIONS MAY NOT BE EXCEEDED:

- Maximum train speed of 60 km/h.
- Maximum average axle load per train of 18.5 ton per axle.
- Maximum axle load per truck per axle of 20 ton.
- Maximum train length of 40 trucks (160 axles).
- Maximum train length on specific line as restricted in WTB.
- Maximum axle load restriction on specific line.
- Maximum total load of 2560 ton on category 1 lines where SASKOP-couplers are used.
- Maximum number of locomotives in a consist is four (4).

Notes :

- 'GC' Means Gradient Category.
- Refer to point 5.9 below for Load Tables relevant to Passenger Trains.

RELEVANT TO VACUUM BRAKED TRAINS THE FOLLOWING RESTRICTIONS MAY NOT BE EXCEEDED:

- Maximum train speed of 60 km/h.
- Maximum average axle load per train of 18.5 ton per axle.
- Maximum axle load per truck per axle of 20 ton.
- Maximum train length of 40 trucks (160 axles).
- Maximum train length on specific line as restricted in WTB.
- Maximum axle load restriction on specific line.
- Maximum total load of 2560 ton on category 1 lines where SASKOP-couplers are used.
- Maximum number of locomotives in a consist is four (4).

Notes : a. 'GC' Means Gradient Category.

GENERAL DEFINITION OF A LIGHT AIRBRAKE CONTAINER TRAIN

A Light Airbrake train is a train consisting of wagons with an average axle load for each vehicle not exceeding 18,5 tons and an average axle load for the train not exceeding 15 tons per axle, and is time sensitive by the nature of the traffic it contains

NOTE

Standard Load Tables as provided for airbrake trains previously within this document may also be utilised for Light Airbrake Container Trains. It merely needs to be noted that the table above is designed for 'Time Sensitive' traffic and using alternate Load Tables might result in a loss of time and a longer through-put time.

PRESCRIBED LOAD TABLES FOR THE RUNNING OF TRANSNET FREIGHT RAIL AIR AND VACUUM BRAKE TRAINS		Document Number : S.GFB/TES/TE/OI 0272
Compiling officer:	A.R. Boy : 	Revision Number : 18
1st Technical Approving Officer	A.R. Boy : 	Issue date: 2018-01-26

Approving Safety Officer:	M. Dlamini : 	

5.23 GENERAL LOAD TABLES FOR PASSENGER TRAINS

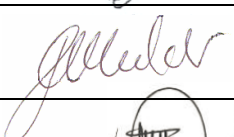

The enclosed load tables indicate the maximum number of coaches to be hauled by the corresponding number of locomotives over the associated routes on Mainline Passenger Trains.

1. ROUTE : Johannesburg to Durban (Both Directions)

Section	Minimum number of Locomotives	Maximum number Coaches
1.1 Johannesburg – Durban/Danskraal	1 x 5E1	10
	2 x 5E1	17
	3 x 5E1	21
	1 x 6E1/17E	13
	1 x 18E	13
	2 x 6E1/17E	21
	2 x 18E	21

2. ROUTE : Johannesburg to Cape Town (Both Directions)

Section	Minimum number of Locomotives	Maximum number of Coaches
2.1 Johannesburg – Kimberley	1 x 5E1	13
	2 x 5E1	18
	3 x 5E1	21
	1 x 6E1/17E	16
	1 x 18E	16
	2 x 6E1/17E	21
	2 x 18E	21
2.2 Kimberley – De Aar	1 x 34D	16
	2 x 34D	21
2.3 De Aar – Beaufort West	1 x 7E	21
2.4 Beaufort West – Worcester	1 x 6E	11
	1 x 18E	11
	2 x 6E	21
	2 x 18E	21
2.5 Worcester – Cape Town	1 x 6E	11
	1 x 18E	11
	2 x 6E	21
	2 x 18E	21
	1 x 33D	10
	2 x 33D	21

3. ROUTE : Worcester to Port Elizabeth (Both Directions)

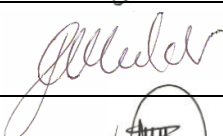

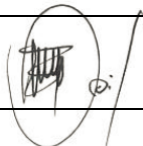

Section	Minimum number of Locomotives	Maximum number of Coaches
3.1 Worcester – Oudtshoorn	1 x 33D	7
	2 x 33D	18
	1 x 35D	7
	2 x 35D	14
	3 x 35D	18
3.2 Oudtshoorn – Klipplaat	1 x 33D	12
	2 x 33D	18
	1 x 34D	14
	2 x 34D	18
3.3 Klipplaat – Port Elizabeth	1 x 35D	7
	2 x 35D	14
	3 x 35D	18
	1 x 34D	9
	2 x 34D	18

4. ROUTE : Johannesburg to Port Elizabeth (Both Directions)

Section	Minimum number of Locomotives	Maximum number of Coaches
4.1 Johannesburg – Kroonstad/Gunhill/Bloemfontein	1 x 5E1	13
	2 x 5E1	18
	3 x 5E1	21
	1 x 6E1/17E	15
	1 x 18E	15
	2 x 6E1/17E	21
	2 x 18E	21
4.2 Bloemfontein – Noupoot/Springfontein	1 x 34D	19
	2 x 34D	21
	1 x 35D	14
	2 x 35D	21
	1 x 34D + 1 x 35D	21
4.3 Noupoot – Port Elizabeth	1 x 7E	21

5. ROUTE – Springfontein to East London (Both Directions)

Section	Minimum number of Locomotives	Maximum number of Coaches
5.1 Springfontein – East London	1 x 7E	16
	2 x 7E	21

6. ROUTE – Kimberley to Bloemfontein (Both Directions)

Section	Minimum number of Locomotives	Maximum number of Coaches
6.1 Kimberley - Bloemfontein	1 x 34D	21
	1 x 35D	15
	2 x 35D	21

7. ROUTE - Bloemfontein to Zastron (Both Directions)

Section	Minimum number of Locomotives	Maximum number of Coaches
7.1 Bloemfontein – Zastron / Thaba Nchu	1 x 35D	14
	2 x 35D	18

8. ROUTE - Kroonstad/Gunhill to Danskraal/Ladysmith (Both Directions)

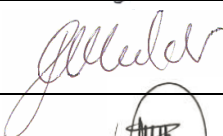

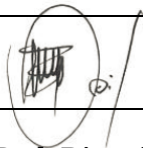

Section	Minimum number of Locomotives	Maximum number of Coaches
8.1 Kroonstad/Gunhill – Danskraal/Ladysmith	1 x 5E1	10
	2 x 5E1	16
	3 x 5E1	21
	1 x 6E1/17E	10
	1 x 18E	10
	2 x 6E1/17E	21
	2 x 18E	21

9. ROUTE – Johannesburg to Mafikeng (Both Directions)

Section	Minimum number of Locomotives	Maximum number of Coaches
9.1 Johannesburg – Mafikeng	1 x 34D	12
	2 x 34D	18

10. ROUTE – Kimberley to Mafikeng via Vryburg(Both Directions)

Section	Minimum number of Locomotives	Maximum number of Coaches
10.1 Kimberley – Mafikeng	1 x 34D	17
